# Algorithms: CSE 202 — Homework 1

For each problem, provide a high-level description of your algorithm. Please make sure to include the necessary details that are crucial for its correctness and efficiency. Prove its correctness and analyze its time complexity.

## Problem 1: Maximum weight subtree

The maximum weight subtree is as follows. You are given a tree T together with (not necessarily positive) weights w(i) for each node  $i \in T$ . A subtree of T is any connected subgraph of T, (so a subtree is not necessarily the entire subtree rooted at a node). You wish to find a subtree of T that maximizes  $\sum_{i \in S} w(i)$ . Design an efficient algorithm for solving this problem. Note that there is a linear (in the number of nodes of the tree) time algorithm for this problem. You can assume that for each node in the tree T, you are given a list of its children as well as the parent pointer (except for the root node).

#### Problem 2: Sorted matrix search

Given an  $m \times n$  matrix in which each row and column is sorted in ascending order, design an algorithm to find an element.

### Problem 3: Largest set of indices within a given distance

You are given a sequence of numbers  $a_1, \ldots, a_n$  in an array. You are also given a number k. Design an efficient algorithm to determine the size of the largest subset  $L \subseteq \{1, 2, \cdots, n\}$  of indices such that for all  $i, j \in L$  the difference between  $a_i$  and  $a_j$  is less than or equal to k. There is an  $O(n \log n)$  algorithm for this problem.

For example, consider the sequence of numbers  $a_1 = 7, a_2 = 3, a_3 = 10, a_4 = 7, a_5 = 8, a_6 = 7, a_7 = 1, a_8 = 15, a_9 = 8$  and let k = 3.  $L = \{1, 3, 4, 5, 6, 9\}$  is the largest such set of indices. Its size is 6.

#### Problem 4: Toeplitz matrices

A Toeplitz matrix is an  $n \times n$  matrix  $A = (a_{ij})$  such that  $a_{ij} = a_{i-1,j-1}$  for  $i = 2, 3, \ldots, n$  and  $j = 2, 3, \ldots, n$ .

- 1. Is the sum of two Toeplitz matrices necessarily Toeplitz? What about the product?
- 2. Describe how to represent a Toeplitz matrix so that two  $n \times n$  Toeplitz matrices can be added in O(n) time.
- 3. Give an  $O(n \lg n)$ -time algorithm for multiplying an  $n \times n$  Toeplitz matrix by a vector of length n. Use your representation from part (b).
- 4. Give an efficient algorithm for multiplying two  $n \times n$  Toeplitz matrices. Analyze its running time.
